TinyTrack

Childcare Enrollment Management System

Lindsey DeDecker | Grand Canyon University | CST – 452 Technology Capstone

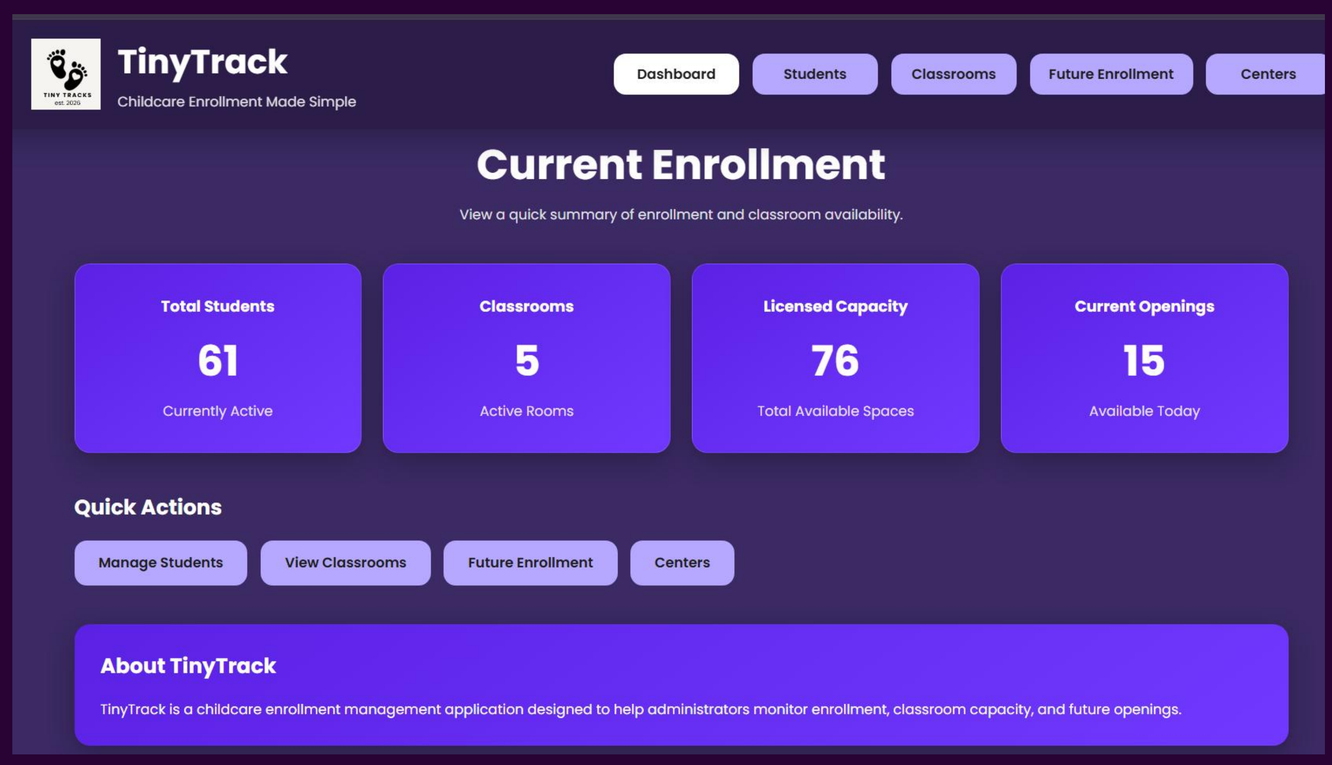

Project Description & Justification

TinyTrack helps childcare administrators manage student records, classroom capacity, and future enrollments in one web application.

Childcare enrollment management involves more than tracking the number of currently enrolled children. Administrators must consider classroom capacity, children's age, upcoming transitions, future start dates and anticipated departure when determining whether space will be available.

TinyTrack was developed to organize this information into one system and provide administrators with a clearer view of current and projected enrollment. By reducing the need to manually compare multiple records and dates, the application supports more efficient enrollment planning and decision-making.

Application View

Dashboard showing current enrollment capacity

Functional Requirements and Specifications

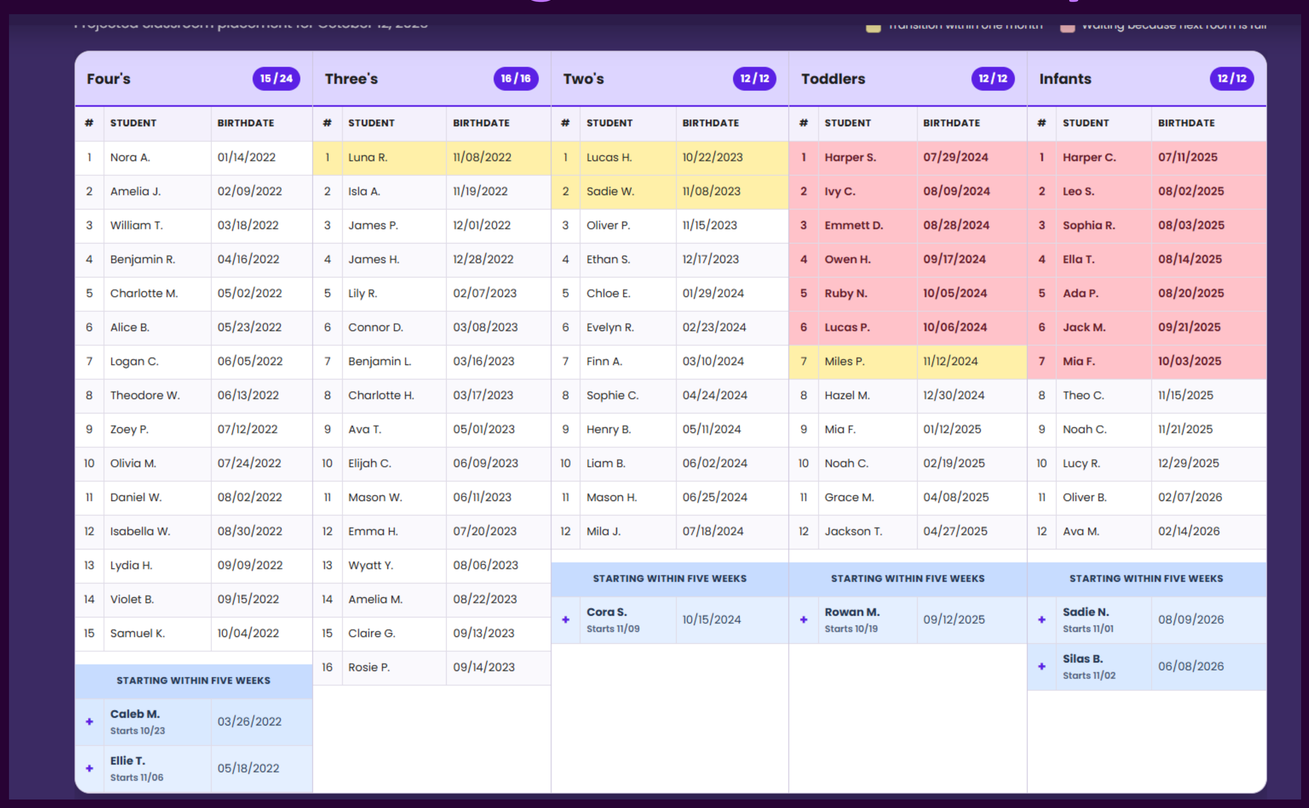

- Multi-center enrollment management
- Add, edit, search, and deactivate students
- Track classroom occupancy and capacity
- Enter future enrollments and start dates
- Projected placement for a selected date
- Flag student records that need review
- Highlight starts within the next five weeks

Design & Development Process

- Java with Spring Boot
- MySQL relational tables for centers, classrooms, and students
- Browser-based administrative screens
- MVC application organization
- Age, start and departure dates and room capacity guide projections
- Administrator login controls use of the app

Projections use each child's age, start and departure dates, and classroom capacity to estimate placement.

Enrollment Planning and Data Summary

Projected classroom placement for October 12, 2026 — Transition within one month — Waiting because next room is full

Four's 15/24			Three's 16/16			Two's 12/12			Toddlers 12/12			Infants 12/12

Classroom planning view. Counts reflect the sample dashboard shown above.

Development Process

1. Define enrollment rules and user needs
2. Model centers, classrooms, and students
3. Build the interface and record workflows
4. Add projections and administrator sign-0in
5. Test workflows and refine the interface

Project Outcome

One place to review enrollment, capacity, upcoming starts, and projected classroom needs.
